

AI Advisor Response

Question:

what is ml

Answer:

Machine Learning (ML) is a field that involves the use of models to solve business problems by ensuring they are useful, reliable, and perform well on unseen data, rather than just checking training accuracy.

Key components related to ML from the provided text include:

- * **Model Evaluation:** Used to determine a model's suitability for a problem by measuring performance on unseen data.
- * **Mathematical Foundations:** ML utilizes linear algebra (scalars, vectors, matrices, and tensors) and calculus (derivatives, partial derivatives, and gradients) to optimize models and minimize loss functions.
- * **Data Preprocessing:** Converts raw data into a model-ready format by handling missing values.
- * **Cloud Platforms:** Services like Azure Machine Learning and AWS SageMaker provide infrastructure for training, deploying, tuning, and monitoring ML systems.
