

AI Advisor Response

Question:

what is ml

Answer:

Machine Learning (ML) is a field that involves the use of models to solve business problems by ensuring they are useful, reliable, and suitable for the task.

Key aspects of ML from the provided context include:

- * **Model Evaluation:** Focuses on measuring a model's performance on unseen data rather than just checking training accuracy.
- * **Mathematical Foundations:** ML relies on linear algebra (scalars, vectors, matrices, and tensors) and calculus (derivatives and gradients) to optimize models and minimize loss functions.
- * **Data Preprocessing:** Involves converting raw, messy data into a model-ready format, such as handling missing values.
- * **Cloud Platforms:** Infrastructure like Azure Machine Learning and AWS SageMaker are used for the training, deployment, tracking, orchestration, and monitoring of ML systems.
